

ABSTRACT OF THE DISCLOSURE

Information that is required to dispatch human resources between organizations in a company or between organizations in companies that cooperate with each other can be registered efficiently. When a dispatchable temporary worker occurs, dispatchable temporary worker information representing the skill of the dispatchable temporary worker, etc., is transmitted from a dispatching terminal to a dispatching information server. When a need for a temporary worker arises, job offer information representing a desired skill for the temporary worker, etc., is transmitted from a job offer terminal to the dispatching information server. The dispatching information server registers the dispatchable temporary worker information from the dispatching terminal therein. If the job offer information registered in the dispatching information server includes information that matches the dispatchable temporary worker information, the dispatching information server transmits the dispatchable temporary worker information to the job offer terminal which has registered the matching job offer information. The dispatching information server registers job offer information from the job offer terminal therein. If the dispatchable temporary worker information registered in the dispatching information server includes information that matches the job offer

information, then the dispatching information server transmits the matching dispatchable temporary worker information to the dispatching terminal.
